Need some reading material to get you through the next meeting that you have no interest in but are required to attend? Well, in that case you might want to take a look at Semiconductor International's Top 100 List of features, blog entries, and webcasts on their website based on the number of views throughout 2007. The articles in the list cover a wide range of the semiconductor spectrum ranging from process development, to nanotechnology, and solar cells. The list actually contains only 99 articles from last year, since it seems that one article from '04 made it onto the list by accident; however, if you don't manage find anything on the list that might be of interest to you, you are either extremely up to date and well read in the semiconductor field, or you have no interest in semiconductors in the first place, in which case you might want to consider a career change.
